We propose a class of locally and asymptotically optimal tests, based on multivariate ranks and signs, for the homogeneity of scatter matrices in  $m$  elliptical populations. Contrary to the existing parametric procedures, these tests remain valid without any moment assumptions, and thus are perfectly robust against heavy-tailed distributions (*validity robustness*). Nevertheless, they reach semiparametric efficiency bounds at correctly specified densities (*efficiency robustness*). In most cases, their normal-score version outperforms Schott's pseudo-Gaussian test (*JSPI* **94**, 25-36, 2001), which, as we also show, actually is a robustified version of the traditional Gaussian likelihood ratio test.

*AMS 1980 subject classification* : 62M15, 62G35.

*Key words and phrases* : Elliptical densities, Scatter matrices, Multivariate ranks and signs, Multivariate analysis of variance, Local asymptotic normality, Locally asymptotically most stringent tests.
